#### **DETAILED ACTION**

#### Election/Restrictions

Applicant's election with traverse of Group II (claims 3-14) in the reply filed on March 16, 2006 is acknowledged. The traversal is on the ground(s) that the inventions were restricted by the examiner as being intermediate-final product. Applicant asserts that the inventions are a combination-subcombination. This is not found persuasive because the intermediate product is deemed to be useful as a packaging laminate sheet for holding a variety of items other than just a battery element found in Group II.

The requirement is still deemed proper and is therefore made FINAL.

## Claim Rejections - 35 USC § 102

The following is a quotation of the appropriate paragraphs of 35 U.S.C. 102 that form the basis for the rejections under this section made in this Office action:

A person shall be entitled to a patent unless -

(b) the invention was patented or described in a printed publication in this or a foreign country or in public use or on sale in this country, more than one year prior to the date of application for patent in the United States.

Claims 3-11 and 13-14 are rejected under 35 U.S.C. 102(b) as being anticipated by Takahashi et al. (US 2001/0038938 A1).

Art Unit: 1746

With respect to Claims 3, 5, 6, 9 and 14, Takahashi et al. discloses an electrochemical element internally sealed in a laminate sheet provided with a thermally welded resin layer (paragraph 0020-0021) and a metallic layer laminated thereon (paragraph 007), comprising: an electric power generating element (10) being sealed in an envelope (30) while terminals or tabs (13, 14) extend out of the envelope, and wherein the resin layer is laminated on to the metallic layer and is in contact with the electrochemical element (paragraph 0077), and wherein the tab and thermally welded resin layer are welded by permitting a thermally welded area, which is formed by at least one of the thermally welded resin layer and the tab, or the thermally welded resin layer and the tab integrally welded to one another (paragraph 0078, Figures 8 and 9) and wherein the thermally welded area is composed of thermally welded resin layer. For examining purposes, examiner is interpreting the term "thermal welded area" as being the portion consisting of the thermally welded resin layer plus the tab.

With respect to Claims 4, 7, 8, 10 and 11, the battery element according to claims 3 and 5, have a resin layer with a thickness of 30 to 130 microns, a metal layer with a thickness of 15 to 150 microns, tabs with a thickness of 50 to 100 microns and the laminate film having an overall thickness of 50 to 200 microns, as well as the thermally welded area having an overall thickness of 80 to 230 microns being composed of the thermally welded resin plus the tab. In Claim 4, Takahashi et al. discloses a thickness of the resin layer (30 to 130 microns) having a value equal to or greater than one half the thickness of the tab, which would be 25 to 50 microns. In

Application/Control Number: 10/659,257 Page 4

Art Unit: 1746

Claim 7, Takahashi et al. discloses the thermally welded area of the thermally welded resin layer is larger than a thickness of a remaining area of the portion thermally welded (80 to 230 microns minus 30 to 130 microns equals 50 to 100 microns) by a value equal to or greater than on half the thickness of the tab, which is 25 to 50 microns. In Claim 8, Takahashi et al. discloses, a thickness of the thermally welded resin area of the thermally welded resin layer is determined to be larger than the thickness of the remaining area portion to be thermally welded (80 to 230 microns minus 30 to 130 microns equals 50 to 100 microns) within a range equal to or less than the thickness of the tab, which is 50 to 100 microns. In Claim 10, Takahashi et al. discloses, a thickness of the thermally welded area (80 to 230 microns) to be equal to or larger than one half the thickness of the tab (25 to 50 microns). In Claim 11, Takahashi et al. discloses the thickness of the thermally welded area (80 to 230 microns) to be equal to or less than the thickness of the tab (50 to 100 microns).

With respect to Claim 13, Takahashi et al. discloses in paragraph 0002, various forms of batteries have been used in a wide variety of applications, mainly automotive.

## Claim Rejections - 35 USC § 103

The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:

(a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negatived by the manner in which the invention was made.

Application/Control Number: 10/659,257 Page 5

Art Unit: 1746

Claim 12 is rejected under 35 U.S.C. 103(a) as being unpatentable over Takahashi et al. (US 2001/0038938 A1) in view of Watanabe et al (US 6,692,866 B2).

Takahashi et al. discloses the laminate battery according to Claim 5 above, including the tab including a negative electrode tab composed of nickel and a positive electrode tab composed of aluminum (paragraph 0085), but does not disclose wherein the cross-sectional area of the negative electrode tab (x) and the positive electrode tab (y) satisfying the following formula:  $1 < x/y \le 2.6$ .

Watanabe et al. discloses the laminate battery having positive and negative tabs of different sizes. The negative tab is larger than the positive tab (column 6 lines 3-4), which would allow for the cross-sectional area of the negative tab (x) to be larger than the cross-sectional area of the positive tab (y) if both are made of equal thickness. When fit into the equation x/y, the end result would be  $1 < x/y \le 2.6$ , when the surface area of the tabs are close to one another.

Takahashi et al. and Watanabe et al. are analogous art because they are from the same field of endeavor, batteries. At the time of the invention, it would have been obvious to a person of ordinary skill in the art to use tabs with a cross-sectional area different than one another, as in the Watanabe et al. reference, for the purpose of diminishing the possibility of short-circuiting the battery and provides a battery with high reliability.

#### Conclusion

Page 6

Any inquiry concerning this communication or earlier communications from the examiner should be directed to Karie O'Neill whose telephone number is (571) 272-8614. The examiner can normally be reached on Monday through Friday from 8am to 5pm.

If attempts to reach the examiner by telephone are unsuccessful, the examiner's supervisor, Michael Barr can be reached on (571) 272-1414. The fax phone number for the organization where this application or proceeding is assigned is 571-273-8300.

Information regarding the status of an application may be obtained from the Patent Application Information Retrieval (PAIR) system. Status information for published applications may be obtained from either Private PAIR or Public PAIR. Status information for unpublished applications is available through Private PAIR only. For more information about the PAIR system, see http://pair-direct.uspto.gov. Should you have questions on access to the Private PAIR system, contact the Electronic Business Center (EBC) at 866-217-9197 (toll-free).
